

Thistle Plaster onto Wienerberger's Porotherm blocks

18th April 2012

British Gypsum warrants the use Thistle Universal One Coat for use on Wienerberger Porotherm blocks.

Thistle Universal One Coat combines the functions of an undercoat and finish coat plaster in one. If used as a 'one coat' product it should be applied to the Porotherm substrate at a thickness of 13mm.

Thistle Universal One Coat may also be used as a backing coat plaster that is finished with Thistle Multi-Finish being applied on top. The Thistle Universal One Coat should be applied at a thickness of 11mm and the Thistle Multi-Finish should be applied at 2mm, giving a total thickness of 13mm. The 'two coat' approach provides an improved surface finish over the 'one coat' approach outlined in the previous paragraph.

The reason behind not permitting one of our other traditional two coat plaster solutions (e.g. Thistle Hardwall) is because they are not currently suitable for the substrate.

If you require any more assistance, please contact the British Gypsum Drywall Academy by emailing bgtechnical.enquiries@bpb.com or calling 0844 800 1991.

Yours sincerely,
